

**Amendments to the Claims:**

This listing of claims will replace all prior versions, and listings, of claims in the application:

**Listing of Claims:**

1. (Currently Amended) A method of analyzing content of a web page with a computing system, said method comprising:
  - executing with a processor one or more software components, wherein the software components include a developer tool for manipulating content of the web page by a developer, a servlet, an analyzer, and a filter;
  - accessing said web page comprising said content with the servlet in response to a request from the development tool, wherein said content comprises secure content and wherein the request from the development tool comprises a request to modify the content of the web page by the developer;
  - intercepting the request from the development tool with the filter and processing the web page with the filter prior to encryption of said secure content by the servlet;
  - transferring the content of the web page from the filter to the analyzer;
  - analyzing the content of the web page with the analyzer prior to encryption of said secure content, wherein analyzing the content comprises measuring conformity of the content of the web page with an established standard;
  - mapping a result of said analyzing to the content of the web page;
  - returning [[a]] the result of said analyzing and said mapping from the analyzer to the servlet;
  - appending the result of said analyzing to the content of said web page with the servlet based on said mapping; and

displaying said the content of the web page and said the result of said analyzing to the developer with the a browser while the developer is manipulating the content of the web page.

2. (Original) The method as recited in Claim 1 wherein said accessing said web page comprising content is performed by an application server operating on a first computing system.

3. (Previously Presented) The method as recited in Claim 2 wherein said filter is a function of the application server, and wherein said filter is selectively activated by a web page development tool accessible to said first computing system.

4. (Original) The method as recited in Claim 2 wherein said server and said filter operate on said first computing system.

5. (Original) The method as recited in Claim 2 wherein said analyzer operates on a second computing system that is communicatively coupled with said first computing system.

6. (Canceled)

7. (Original) The method as recited in Claim 1 wherein said filter transfers content of the web page to the analyzer in a hypertext mark-up language (HTML) format.

8. (Canceled)

9. (Currently Amended) A computer system comprising:  
a bus;  
a memory unit coupled with said bus; and  
a processor coupled with said bus, said processor configured to execute a method of analyzing content of a web page comprising:

receiving a request for said web page from a development tool for manipulating content of the web page during testing or development of the web page;

generating said web page on a server in response to the request, wherein said content comprises secure content;

processing the web page using a filter prior to encryption of said secure content;

transferring the content of the web page from the filter to an analyzer;

analyzing the content of the web page prior to encryption of said secure content, wherein analyzing the content comprises measuring conformity of the content of the web page with an established standard;

mapping a result of said analyzing to the content of the web page;

returning ~~[[a]]~~ the result of said analyzing and said mapping to said server; ~~and~~

appending the result of said analyzing to the content of said web page based on said mapping; and

providing the content of the web page and the result of said analyzing to a browser the developer while the developer is performing said testing or development of the web page.

10. (Original) The computer system of Claim 9 wherein said server is an application server operating on a first computing system.

11. (Original) The computer system of Claim 10 wherein said filter is a function of the application server.

12. (Original) The computer system of Claim 10 wherein said server and said filter operate on said first computing system.

13. (Original) The computer system of Claim 12 wherein said request for said web page is generated by a browser operating on said first computing system.

14. (Original) The computer system of Claim 10 wherein said analyzer operates on a second computing system that is communicatively coupled with said first computing system.

15. (Canceled)

16. (Original) The computer system of Claim 9 wherein the filter transfers content of the web page to the analyzer in a hypertext mark-up language (HTML) format.

17. (Currently Amended) A computer-usable medium having computer-readable program code embodied therein for causing a computer system to perform a method of analyzing content of a web page, said method comprising:

accessing said web page comprising said content in response to a request from a development tool for manipulating content of the web page by a developer, wherein said content comprises secure content and wherein accessing said web page is ~~performed~~ performed during testing or development of the web page;

processing the web page using a filter prior to encryption of said secure content;

transferring the content of the web page from the filter to an analyzer;

analyzing the content of the web page at said analyzer prior to encryption of said secure content, wherein analyzing the content comprises measuring conformity of the content of the web page with an established standard;

mapping a result of said analyzing to the content of the web page;

returning [[a]] the result of said analyzing and said mapping to a server;

appending the result of said analyzing to the content of said web page based on said mapping; and

displaying said the content of the web page and said the result of said analyzing to the developer while the developer is performing testing or development of the web page.

18. (Original) The computer-usable medium of Claim 17 wherein said generating of a web page comprising content is performed by an application server operating on a first computing system.

19. (Original) The computer-usable medium of Claim 17 wherein said filter is a function of the application server.

20. (Original) The computer-usable medium of Claim 18 wherein said server and said filter operate on said first computing system.

21. (Original) The computer-usable medium of Claim 18 wherein a request for said web page is generated by a browser operating on said first computing system.

22. (Original) The computer-usable medium of Claim 18 wherein said analyzer operates on a second computing system that is communicatively coupled with said first computing system.

23. (Canceled)

24. (Previously Presented) The computer-usable medium of Claim 17 wherein the filter transfers content of the web page to the analyzer in a hypertext mark-up language (HTML) format.

25. (Previously Presented) The method of Claim 1, wherein said processing a web page further comprises performing sequential filtering of said web page using a plurality of filters of said filter.

26. (Previously Presented) The method of claim 1, wherein accessing said web page, intercepting the request from the development tool, transferring the content of the web page, and analyzing the content of the web page are performed during testing or development of the web page by the developer.

27. (Previously Presented) The method of claim 26, wherein returning a result of said analyzing, appending the result of said analyzing to the content of said web page, and displaying said web page and said result are performed during the testing or development of the web page by the developer.
